

DATA STORYTELLING

STATISTICAL VALIDATION

Data Analytics Internship
Apex Planet Software Pvt.Ltd
Presented by: Kancharla Nithyasri

EXECUTIVE SUMMARY

INFRASTRUCTURE

Successfully unified 9,994 transaction records into a **MySQL** pipeline, ensuring data integrity.

INTELLIGENCE

Identified core operational KPIs and regional bottlenecks via **Power BI** interactive modeling.

VALIDATION

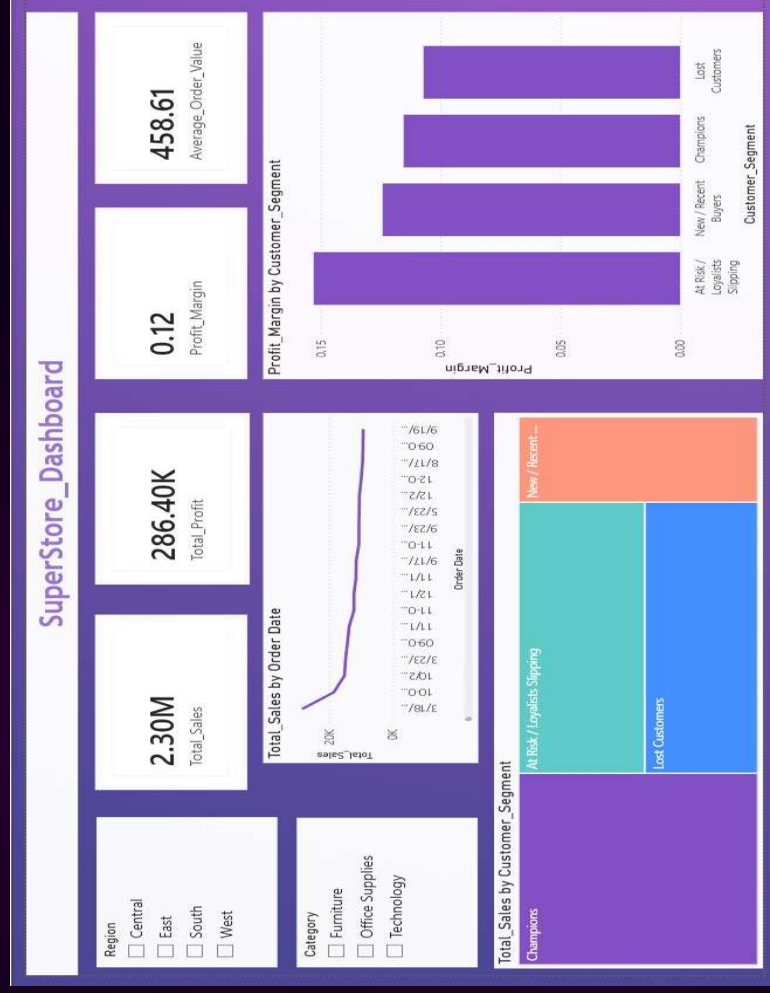

Used **T-Tests** to mathematically prove purchasing behaviors, removing business guesswork.

DATA PIPELINE ARCHITECTURE

- ✓ **Extraction:** Raw records migrated to centralized MySQL schema.
- ✓ **Cleaning:** Handled missing values and standardized data via Pandas.
- ✓ **Mockups:** Designed low-fidelity Excel wireframes for KPI prioritization.

OPERATIONAL KPI MONITORING

KEY DISCOVERIES

Our star-schema model in **Power BI** revealed:

Profit margins fluctuate significantly by product sub-category.

Regional shipping delays are the primary driver of customer churn.

THE SCIENTIFIC HYPOTHESIS

"Do Corporate clients spend significantly more per order than regular Consumers?"

NULL (\$H_0\$)

Mean Sales are identical across segments
($\mu_1 = \mu_2$).

ALTERNATIVE (\$H_A\$)

Mean Sales differ significantly ($\mu_1 \neq \mu_2$).

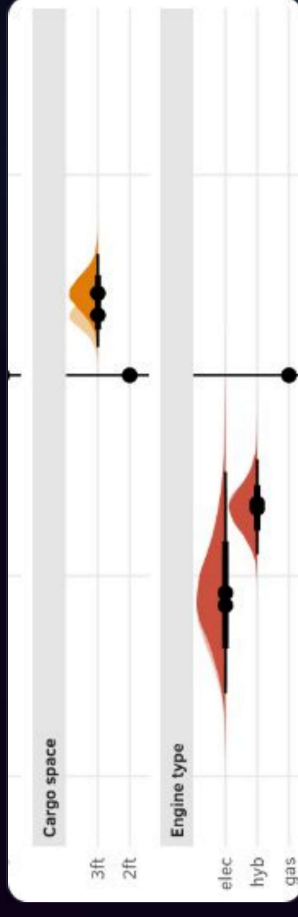

VALIDATION RESULTS (WELCH'S T-TEST)

0.458
P-VALUE ($P > 0.05$)

THE MATHEMATICAL VERDICT

Across 8,211 combined orders, we failed to reject the Null Hypothesis.

Conclusion: Purchasing power per cart is uniform. Observed gaps are purely random sampling variance.

STRATEGIC CALL TO ACTION

STOP BUDGET LEAK

Cancel plans for custom pricing tiers for Corporate accounts; their cart value matches Consumers.

PIVOT TO FREQUENCY

Redirect budget to **Subscription Models** to increase order volume rather than size.

FIX LOGISTICS

Tighten SLAs in high-churn regions identified in Task 3 to protect existing retention.

Thank you
